接口基础

在v2接口注意事项:

- 1. 通过后台获取key和secret
 - key 用于获取token的值
 - secret 用于于校验提交的数据
 - 一般情况下输入接口的参数为只有3个参数:
 - token 用于确定是否有登录权限,通过api/login接口中获取的登录,有效时间不超过1小时
 - data 传入的数据全部使用
 - sign 用于验证data数据
- 1. 增加数据加密字符串
- 2. data 数据的组成采用 RFC1738, 经过base64加密

如要传参数 order_id=10&shipping_id=1

base64_encode("order_id=10&shipping_id=1");

- 3. 数据验证
- 4. sign 由data的未加密前的数据与secret组成新的字符串再使用md5生成hash.

使用上面的例子: order_id=10&shipping_id=1

假如secret的值为#11111#

md5("#11111#order id=10&shipping id=1#11111#")

- 5. 返回数据,采用json结构
- 6. status_no 错误编码.具体查看状态表.
- 7. msg 提示
- 8. info 字典

6.常见字段说明
